This document herein describes the Scope of Work involved in creating a customizable storefront for unique customers of Metro Vista. This document will go into detail about the work involved as well as functionality required by Metro Vista. Any updates and changes requested by Metro Vista will be discussed in full and charged a payment of monies when necessary at Virtual Stacks discretion. Below is an overview of what has been discussed.

Index

eZnetERP subsection: **Website**

This is the section of the ERP for eZnetERP that will primarily be worked on. It contains several different modules that allows the user to create different types of menus, forms, pages, and integrate them interchangeably. Below contains a list of each module and a brief description of what the module does.

Menu: This works essentially as the sitemap to your website. This will be used the user to navigate to the different pages you have available on your website.

Form: This is a customizable form that can be attached to different pages in order to accomplish certain things like gathering contact information, subscription purpose, or leaving a comment. You can create your own custom fields and view data that is generated by that field.

Sub Domain: This section will allow the Administrator to add sub-domains to their website

Item: In this section the administrator will be able to upload different items and point them to different end-users based on preferences.

User: In this section you will be able to add, modify, and delete users.

Administrative

This portion of the application is considered the Administrative side which is controlled by Metro Vista. What this means is that Metro Vista can perform the following administrative tasks

I. User Registration and Creation
II. User Item Visibility and Customization
III. Logo upload
IV. User Settings

User Registration and Creation
This feature will enable you to Create and Register different users to the Website webapp. They will also be able to freely register themselves. After registering a user you will be able to set the visibility of items for that customer.

User Item Visibility and Customization
After a user is registered it is up to the administrator to set what items are visible to that newly registered user. You can create and select items by filling out necessary information and pointing these items to the registered user. These items will only ever be visible if it is pointed to the user. There will also be an option to have the user see all items.

Logo Upload
Logos can be assigned to each registered user to enhance the look of their purchasing portal.

User Settings
User settings is an administrative section that allows the administrator to add, modify, or delete users. There will also be a section that lets the administrator add a user to a group of users.

Custom Login

This sections describes how the user experience should look and feel when the User logs into the Portal Metro Vista creates using this Application. **Custom Login** also covers security details.

    I.   Login Detail Requirements
   II.   GUI Experience
  III.   Logo plugin on User Login

Login Detail Requirements
When the user is logging they are required to fill out a username and password. This was generated when the user register or when Metro Vista registered the user.

GUI Experience
The portal to login will be the same regardless of which theme is selected for the user.

Logo plugin on User Login
Once the user logs in to the purchase platform the logo will be placed on the website they've logged into.

User Experience

This section describes what the user will experience when using the purchase platform. It will also cover selecting an item and purchasing an item.

- I.   First Time Login
- II.   Selecting an Item for Purchase
- III.   Purchasing Selected Items

First Time Login
After the user has logged in for the first time they will see a custom menu bar which will have already been created by Metro Vista. They will also see all or some of the items they normally purchase in the middle of the screen.

Selecting an Item for Purchase
When the end-user clicks on an item the website will go to that items description page. This page will display previously filled out data so that the user knows what they are purchasing and how much it will cost. The user will be able to select multiple items for purchase at one time. These items once selected will be stored in a "Shopping Cart Like" section of the website.

Purchasing Selected Items
After the end-user is finished selecting items they can go to the purchase section of the website. This section contains all items that were selected previously. The end-user then fills out all necessary information and presses **Send Order**. This will trigger an email to be sent to the appropriate party based on the **Settings** that were selected based on the Administrations preferences.
